

Public Health
England

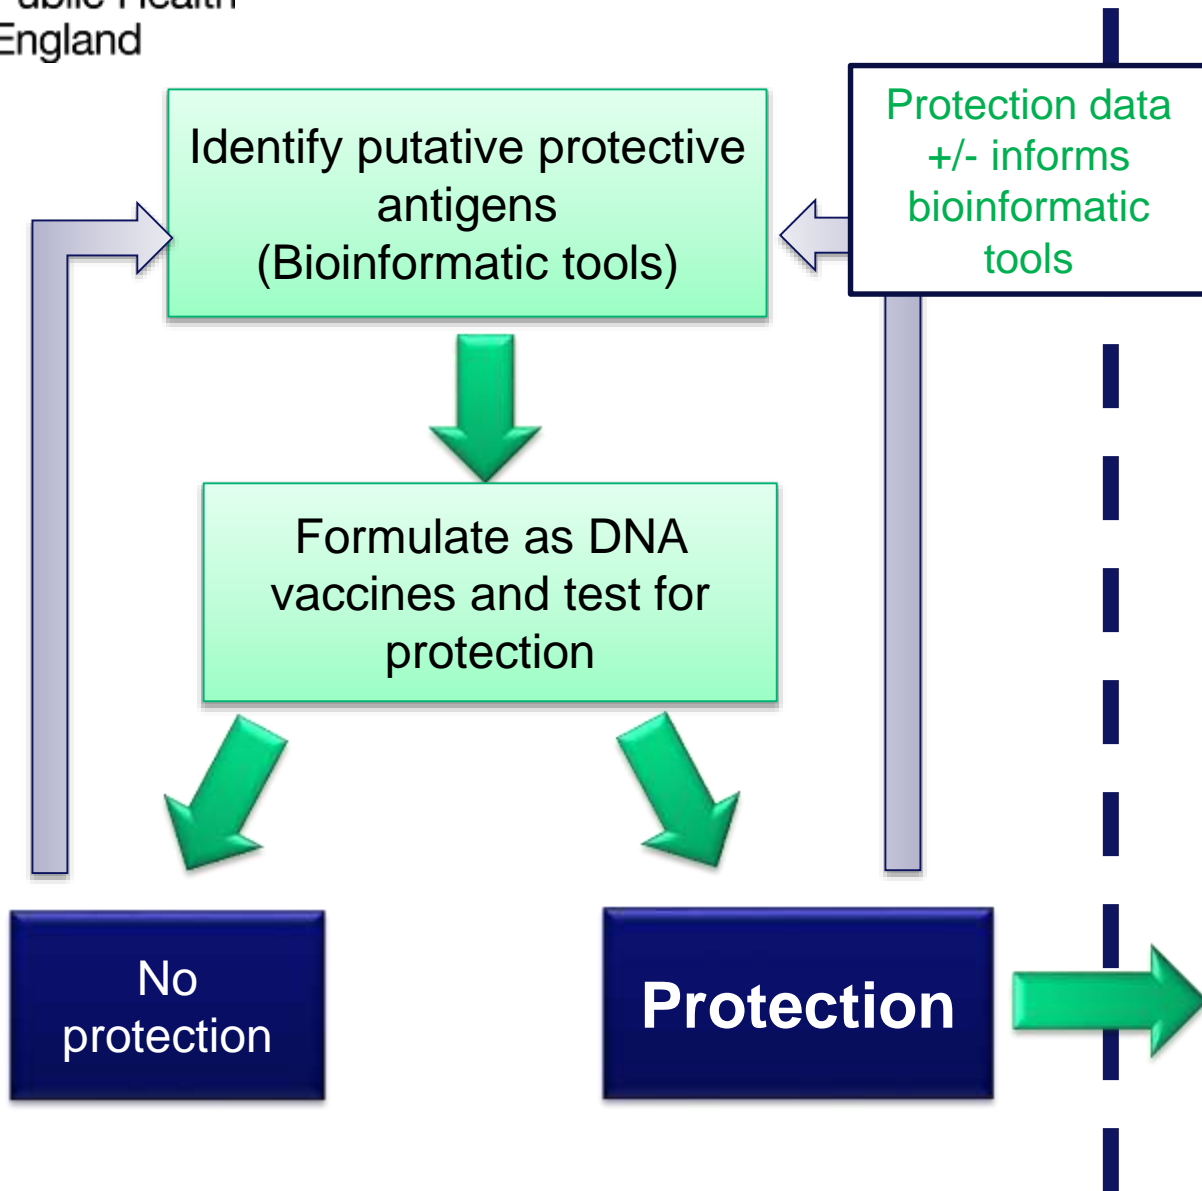

Evaluation of new antigens for subunit vaccines against *Mycobacterium tuberculosis*.

**PHE Porton Down
University of Oxford / Jenner Institute
University of Southampton**

13 February 2015

Project Concept

Beyond CiC award

- IP protect
- Follow on funding
- Improve formulation e.g. viral vector, combinations of antigens
- Product development input e.g. TBVI
- Advanced testing

Project Outline

Identify putative protective antigens
(Bioinformatic tools)

UNIVERSITY OF
Southampton

Shortlist (6) based
on novelty/ease of
formulation /
expression....

Public Health
England

Original plan
Test 10 candidates for
immunogenicity and 3
tested for protection

Better use of reduced
funding to test more for
protection

Construction of
DNA vaccines and
QC

Evaluate protection in
preclinical model of TB

TRAINING

RECALL

Training Data Set of 136 Positive and 136 Negative Proteins.

19 bioinformatic tools were used to generate 122 annotation features.

Support Vector Machine. Trained and Tested using the 122 annotation features. Accuracy 91.6%.

BPA training data

Annotated training data

SVM

LTOC V

Feature selection

SVM-BPA classifier (Figure 2)

Bacterial proteome

Annotate *Mycobacterium tuberculosis* proteome with the same 19 bioinformatic tools.

Annotated bacterial proteome

Run annotated *M.tuberculosis* genome through Support Vector Machine.

Proteome ranked for antigenicity

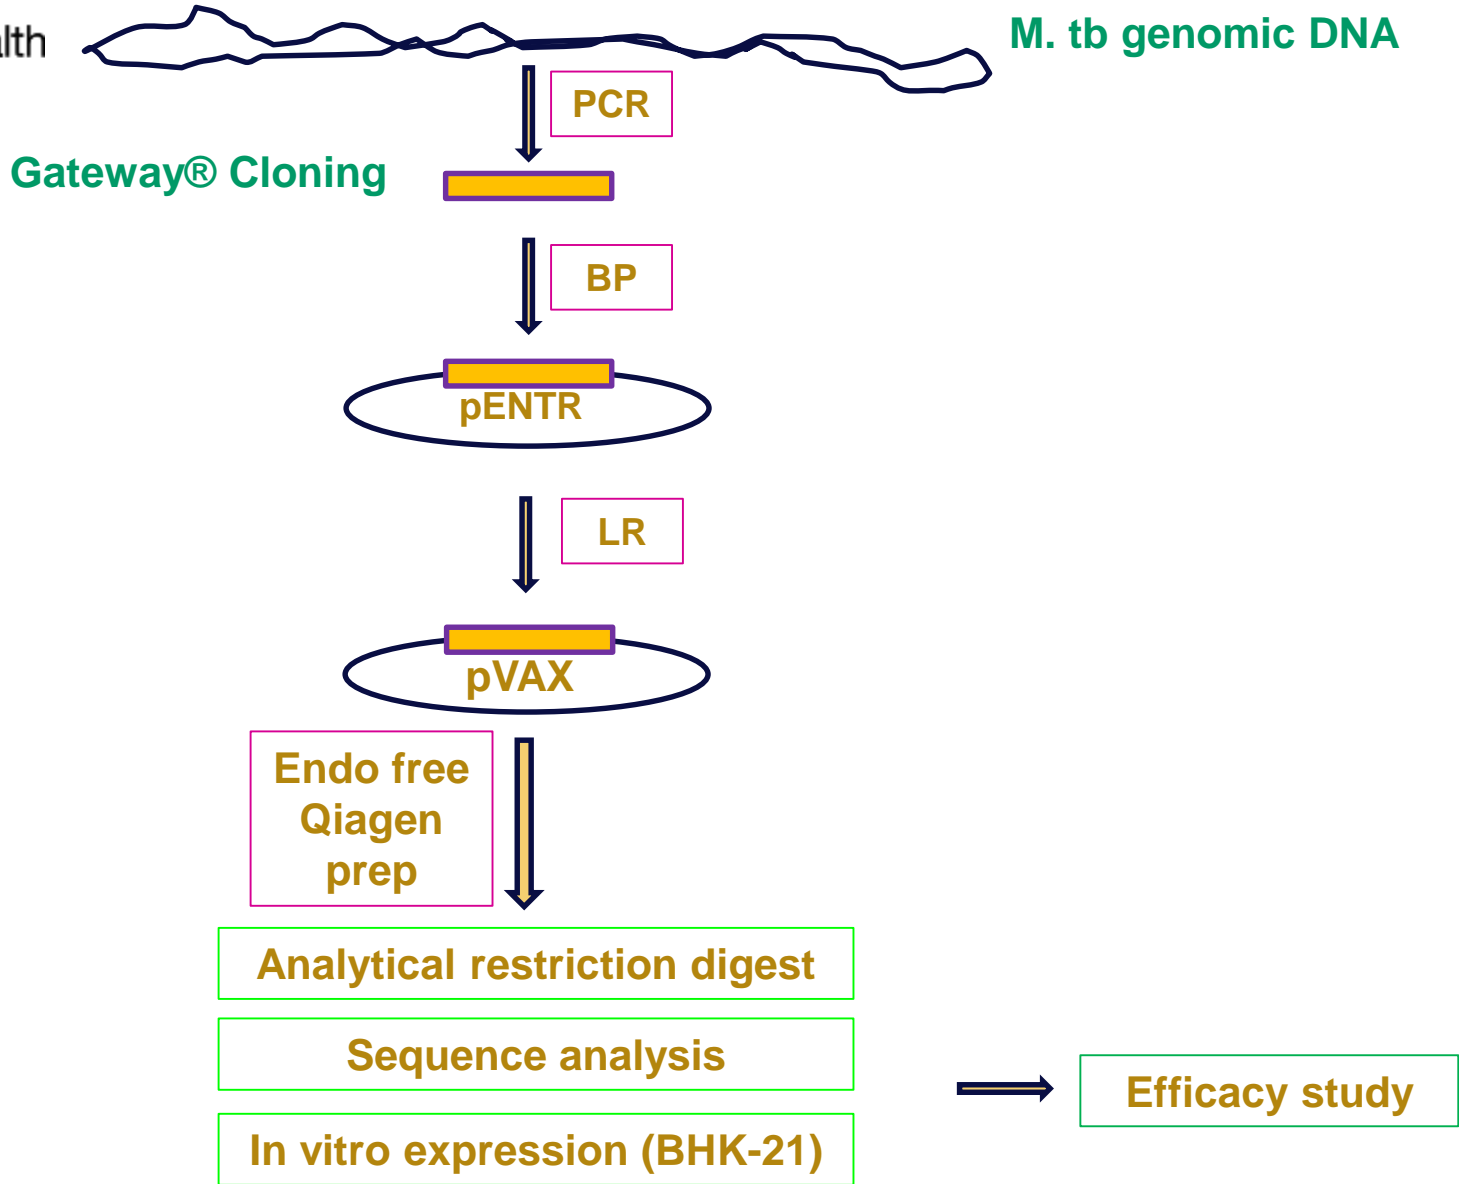

Top 100 Predicted tuberculosis Antigen List

Annotate proteins with protein annotation tools (Supplemental Table 2)
